interoperability *is* usability

ARD strategy processing levels

Level	motto	Dove	SkySat	RE	Sentinel-2	MODIS	Landsat-8	HLS	latency	geometry	radiometry	delivery
L0	raw	raw frames		N/A					3 hour	G0	R0	internal, R&D
L1a	raw video frames	radiometrically-corrected at-sensor radiance										
L1b NRT	ortho ready	L1b, registered, rectified sensor-space, geolocated, TOAR		as provided NRT L1 TOAR products					6 hours	G1	R1	catalog, orders API
L2v XYZ	visual	CIE XYZ color-space, 8- or 16-bit, with color profiles, TOAR-based, web-mercator or UTM-projected								G2	R3	orders API
L2b ARD	SR+GRI*	6SV-corrected via MODIS/VIIRS, UTM projected, with RSRs and SBAF matrices							12 hours		R2	catalog, orders API
L3h HLS	timeseries	harmonized to HLS/sen2like, gap-filled, cloud-masked, CESTEM-based, polygon-based, streamable										
L3c CRD	streaming	8-bit curved TOAR, chips, image pyramid flat catalog, 3D geometry descriptors							6 hours			orders API
L3d LAS	3D mesh	TBD 3D mesh from single capture 7.5km x 7.5km							1 day	G3	R5	orders API

Dove Classic sensor layout

orthorectification

- This is the layout of the two-stripe Dove
 - The top stripe contains the red, blue and green bands in a Bayer pattern
 - The bottom stripe contains the NIR band
 - The orthorectification process allows a four band composite image to be produced

Typical Dove Classic RSR (measured at 10nm resolution)

Dove-R sensor layout

- This is the layout of a Dove-R

- The four bands are arranged vertically across the sensor
- Multiple images are taken in rapid succession so that the same point on the Earth is imaged by all the filters as the satellite orbits
- Subsequent frames are composited together in a structure from motion pipeline to create a four band composite image

Typical Dove-R RSR (from manufacturer data)

RSR compared to Sentinel-2A

Effects of Differing Responses: Dove Classic

RSR vs Surface Spectrum: Green Grass

SBAF Corrections <i>Dove Classic</i> → <i>Sentinel-2</i>	
Blue	0.942
Green	1.368
Red	0.768
NIR	1.036

Calculating the spectral band adjustment factors between Sentinel-2 and Dove Classic

Effects of Differing Responses: Dove-R

RSR vs Surface Spectrum: Green Grass

SBAF Corrections <i>Dove-R → Sentinel-2</i>	
Blue	1.031
Green	1.042
Red	0.970
NIR	1.000

Calculating the spectral band adjustment factors between Sentinel-2 and Dove-R

An aerial photograph of a landscape, likely a national park, with a semi-transparent topographic map overlaid. The map features contour lines in shades of brown and red, indicating elevation changes. The landscape below shows green vegetation, brownish soil, and some small structures or buildings. A white crosshair is visible in the upper left corner of the map overlay.

Current calibration process

Iguazú National Park, Brazil – September 23, 2016

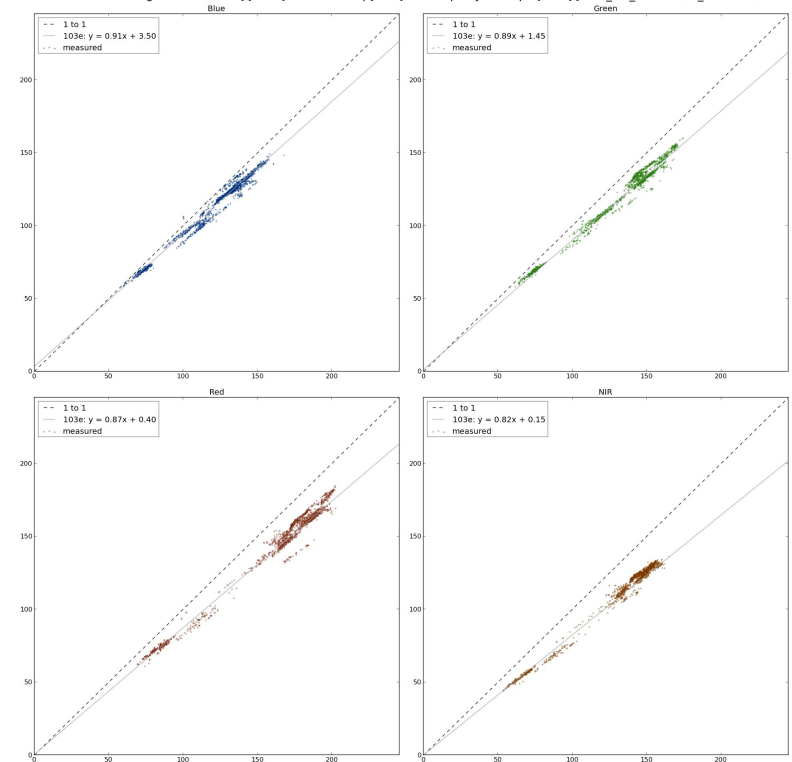

Calibration Approach

Cross Calibrating Doves to RapidEye

- Instantaneous crossovers sampled, corrected, and stored.
 - Crossovers sourced from RapidEye (RE) and Dove to Dove Crossovers if RE data lacking
- Crossovers cover the brightness range from 50 to 150 watts/m-2 sr-1 um-1
- Average of 5 crossover events and 500 samples used per-satellite/band to update calibration

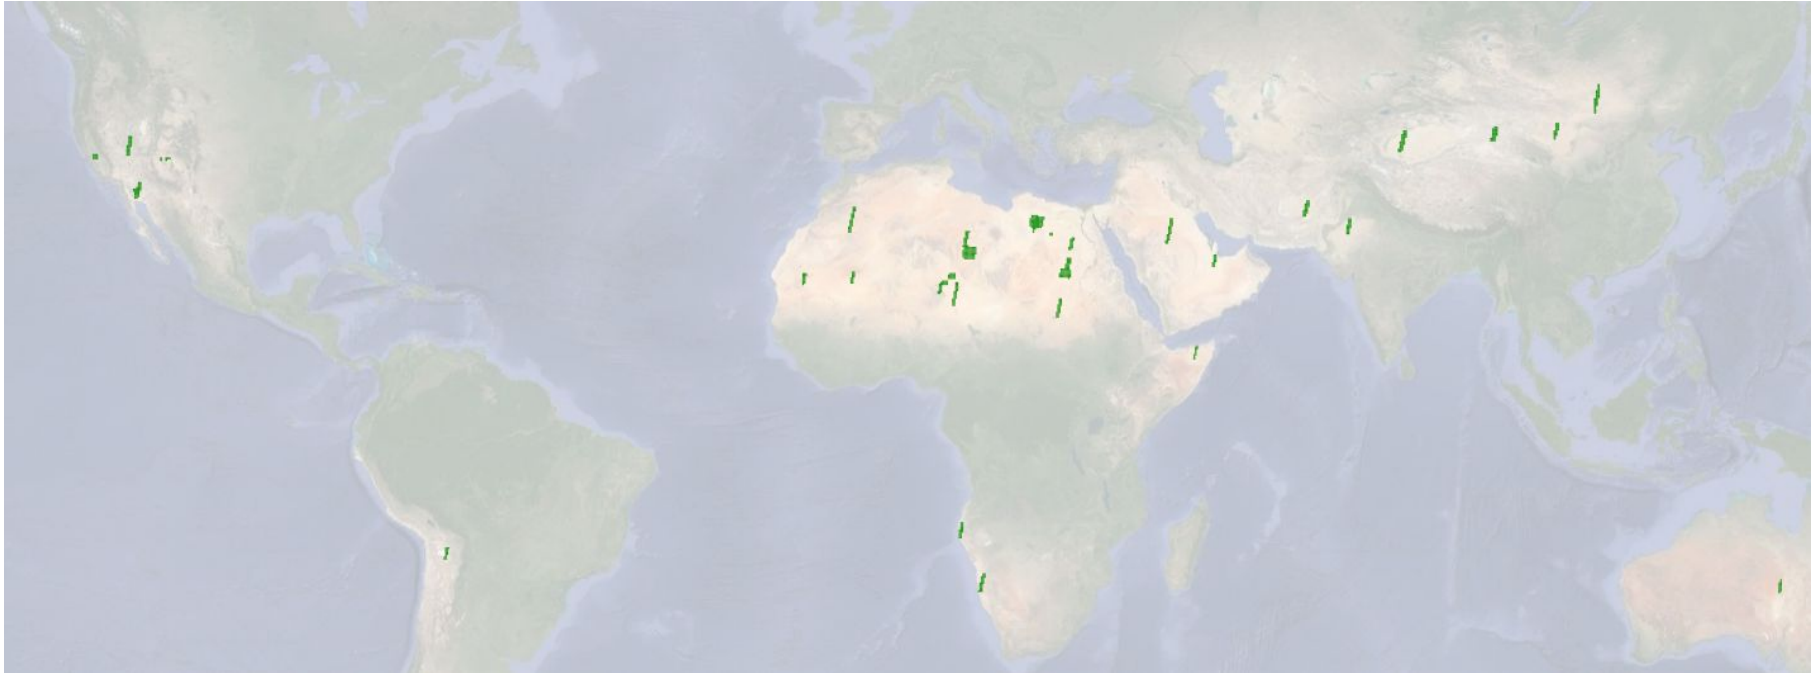

Calibration Sites

Globally distributed network of desert calibration sites

27 sites covering a range of bright and dark features to capture full dynamic range

Revised calibration process

Iguazú National Park, Brazil – September 23, 2016

A summary of the crossovers for a single satellite

Showing the footprint of the crossovers for a single satellite. The entire set of crossovers was filtered using statistics to filter out the images affected by clouds.

A timeline of the crossovers

The number of crossover orthotiles for each day in the time of interest. The orthotiles were filtered so that only crossover events that overlapped over 50% of the orthotile.

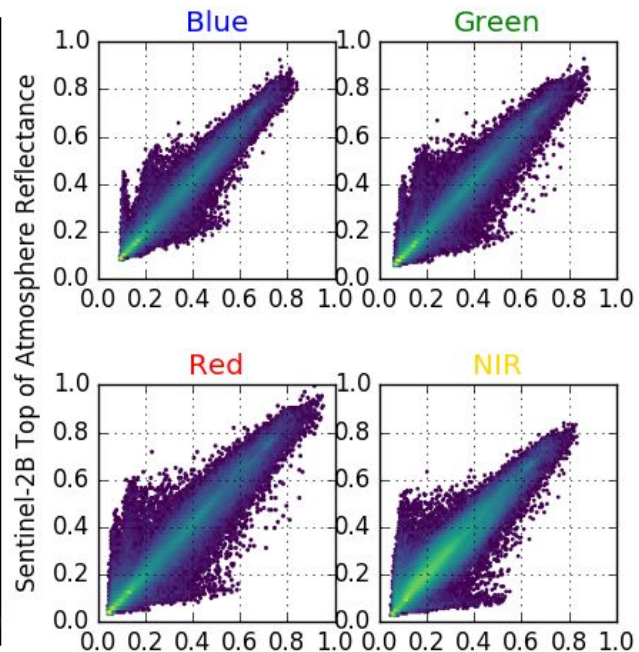

+

Results for a single satellite

Iguazú National Park, Brazil – September 23, 2016

An example crossover

1067 Top of Atmosphere Reflectance

An example crossover

An example crossover

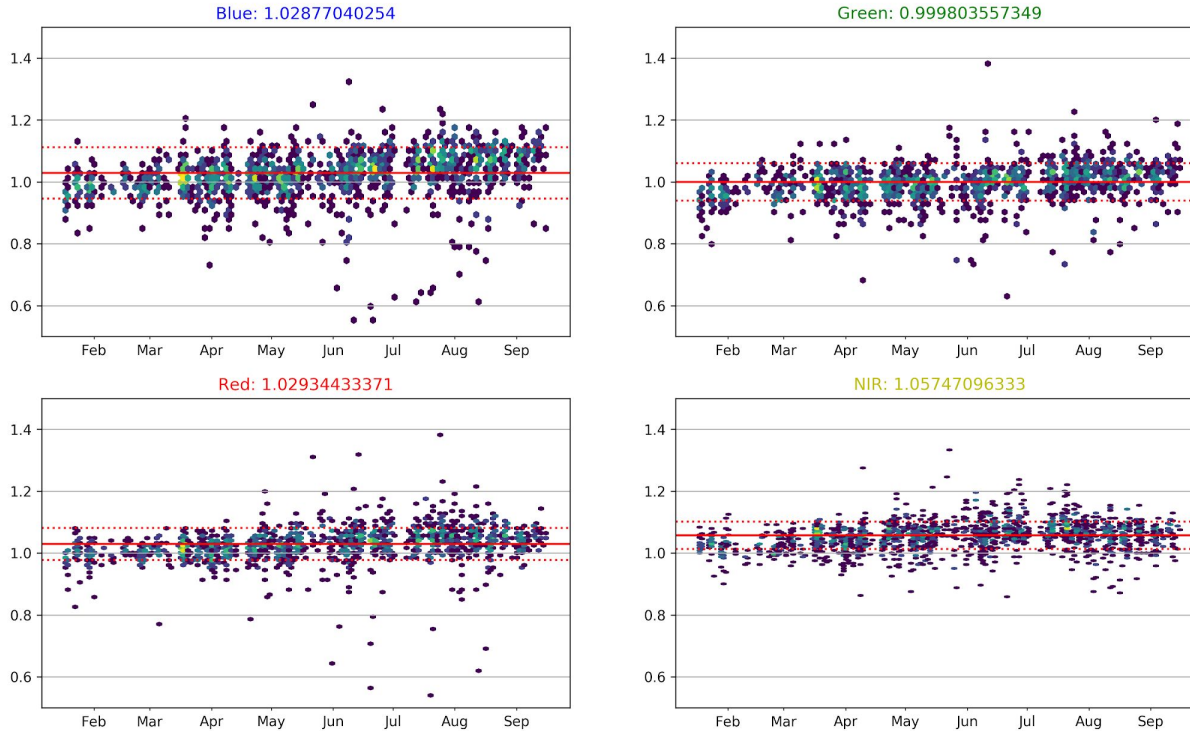

All the crossovers for a single satellite

All 1644 orthotile events on a single plot. Each orthotile event was summarised as a single statistic in this scatter plot. The joint-mode of the candidate and reference measurements over the entire orthotile was chosen as the summary statistic (mirroring our own calibration process). The dynamic range of the dataset is much wider than with calibration sites, with a lot of data in over darker scenes. This reflects the data over terrain types where the data is frequently used (e.g. agricultural areas)

The fit of all the crossovers over time

Showing the range of fits over time. The fit between the reference and candidate measurements for each orthotile crossover event is shown to investigate if there is any seasonal variation.

All the crossovers for all Dove-Rs

All 33452 orthotile events for all satellites (over 257 days) on a single plot. The same filtering was done as for a single satellite.

L1 DATA QUALITY REPORT PLANETSCOPE

Product Anomalies

Major known anomalies, actively being worked on and planned to be fixed in the future

- Blurry overlap between successive scenes
- Tonal difference between successive scenes
- Saturation and Blooming - significantly less frequent in Dove-R
- Tap imbalance
- NIR misalignment - only Dove-Classic
- Misalignment between successive scenes
- Missing scenes in a Strip
- Frame-rate issue

L1 DATA QUALITY REPORT PLANETSCOPE

Product Features - Dove-Classic

- J2K compression artifacts
- Zipper artifact through debayering

L1 DATA QUALITY REPORT PLANETSCOPE

Product Features - Dove-R

- Clouds
- Planes
- Steep terrains
- Waves

Region I: band 4
Region II: band 5
Region III: band 13
Region IV: band 2
